

## Data Transformation

Data was cleaned and transformed using Power Query. Missing values were handled by replacing numeric nulls with 0 and retaining or labeling non-critical fields as "Unknown". Duplicate records were removed to maintain data integrity. Data types were corrected, and a month column was created from the order date for time-based analysis.

---

### ◆ Data Merging

The List of Orders and Order Details tables were merged using Order ID to create a consolidated Orders Data table. This allowed combining customer and transaction-level information for analysis.

---

### ◆ Data Modeling

Relationships were established between List of Orders and Order Details using Order ID (one-to-many), and between Order Details and Sales Target using Category (many-to-one). These relationships were validated in Manage Relationships to ensure they are active and correctly defined.
